

## Chapter Four: Loops

Slides prepared by Evan Gallagher, New York University

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Chapter Goals

- To learn about the three types of loops:
  - **while**
  - **for**
  - **do**
- To avoid infinite loops and off-by-one errors
- To understand nested loops
- To implement programs that read and process data sets
- To use a computer for simulations

C++ for Everyone by Cay Horstmann

## What Is the Purpose of a Loop?

A loop is a statement that is used to:

execute one or more statements  
repeatedly until a goal is reached.

Sometimes these one-or-more statements  
will not be executed at all  
—if that's the way to reach the goal

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The Three Loops in C++

C++ has these three looping statements:

```
while
for
do
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The while Loop (4.1)

Execute statements until a condition is true

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The while Loop

```
while (condition)
{
    statements
}
```

The *condition* is some kind of test  
(the same as it was in the **if** statement in Chap. 3)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The while Loop

```
while (condition)
{
    statements
}
```

The statements are repeatedly executed until the condition is **false**

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The while Loop

## SYNTAX 4.1 while Statement

If the condition never becomes false, an infinite loop occurs.

Beware of "off-by-one" errors in the loop condition.

Don't put a semicolon here!

```
while (balance < TARGET)
{
    year++;
    balance = balance * (1 + rate / 100);
}
```

Braces are not required if the body contains a single statement, but it's good to always use them.

Linking up braces is a good idea.

These statements are executed while the condition is true.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Using a Loop to Solve the Investment Problem.

The algorithm for an investment problem:

1. Start with a year value of 0 and a balance of \$10,000.
2. **Repeat** the following steps  
**while the balance is less than \$20,000:**
  - Add 1 to the year value.
  - Multiply the balance value by 1.05 (a 5 percent increase).
3. Report the final year value as the answer.

"Repeat .. while" in the problem indicates a loop is needed. To reach the goal of being able to report the final year value, adding and multiplying must be repeated some unknown number of times.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Using a Loop to Solve the Investment Problem.

The statements to be controlled are:

- Incrementing the **year** variable
- Updating the **balance** variable using a **const** for the **RATE**

```
year++;
balance = balance * (1 + RATE / 100);
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Using a Loop to Solve the Investment Problem.

The condition, which indicates when to **stop** executing the statements, is this test:

```
(balance < TARGET)
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Using a Loop to Solve the Investment Problem.

Here is the complete **while** statement:

```
while (balance < TARGET)
{
    year++;
    balance = balance * (1 + RATE / 100);
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Flowchart of the Investment Calculation's while Loop

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The Complete Investment Program

```

#include <iostream>
using namespace std;

int main()
{
    const double RATE = 5;
    const double INITIAL_BALANCE = 10000;
    const double TARGET = 2 * INITIAL_BALANCE;

    double balance = INITIAL_BALANCE;
    int year = 0;

    while (balance < TARGET)
    {
        year++;
        balance = balance * (1 + RATE / 100);
    }

    cout << "The investment doubled after "
         << year << " years." << endl;

    return 0;
}
  
```

ch04/doublinv.cpp

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

1 Check the loop condition

balance = 10000  
year = 0

```

while (balance < TARGET)
{
    year++;
    balance = balance * (1 + rate / 100);
}
  
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

1 Check the loop condition

balance = 10000  
year = 0

```

while (balance < TARGET)
{
    year++;
    balance = balance * (1 + rate / 100);
}
  
```

The condition is true

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

1 Check the loop condition

balance = 10000  
year = 0

```

while (balance < TARGET)
{
    year++;
    balance = balance * (1 + rate / 100);
}
  
```

The condition is true

2 Execute the statements in the loop

balance = 10500  
year = 1

```

while (balance < TARGET)
{
    year++;
    balance = balance * (1 + rate / 100);
}
  
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

Check the loop condition again

balance = 10500  
year = 1

```

while (balance < TARGET)
{
    year++;
    balance = balance * (1 + rate / 100);
}
  
```

The condition is still true

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

Check the loop condition again

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is still true

balance = 10500  
year = 1

Execute the statements in the loop

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

balance = 11000  
year = 2

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

Check the loop condition again

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is still true

balance = 11000  
year = 2

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

Check the loop condition again

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is still true

balance = 11000  
year = 2

Execute the statements in the loop

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

balance = 11500  
year = 3

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

...This process continues  
for 15 iterations...

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

4 After 15 iterations

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is no longer true

balance = 20789.28  
year = 15

5 Execute the statement following the loop

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
cout << year << endl;
```

balance = 20789.28  
year = 15

The final output indicates  
that the investment  
doubled in 15 years.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Program Run

1 Check the loop condition

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is true

balance = 10000  
year = 0

2 Execute the statements in the loop

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

balance = 10500  
year = 1

3 Check the loop condition again

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is still true

balance = 10500  
year = 1

4 After 15 iterations

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
```

The condition is no longer true

balance = 20789.28  
year = 15

5 Execute the statement following the loop

```
while (balance < TARGET) {
    year++;
    balance = balance * (1 + rate / 100);
}
cout << year << endl;
```

balance = 20789.28  
year = 15

C++ for Everyone by Cay Horstmann

### More while Examples

For each of the following, do a hand-trace  
(as you learned in Chap. 3)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Example of Normal Execution

while loop to hand-trace

```
i = 5;
while (i > 0)
{
    cout << i << " ";
    i--;
}
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### When i Is 0, the Loop Condition Is false, and the Loop Ends

while loop

```
i = 5;
while (i > 0)
{
    cout << i << " ";
    i--;
}
```

The output

1 2 3 4 5

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Example of a Problem – An Infinite Loop

while loop to hand-trace

```
i = 5;
while (i > 0)
{
    cout << i << " ";
    i++;
}
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Example of a Problem – An Infinite Loop

The `i++;` statement makes `i` get bigger and bigger  
the condition will never become false –  
an infinite loop

*i is set to 5*

while loop

```
i = 5;
while (i > 0)
{
    cout << i << " ";
    i++;
}
```

The output never ends

5 6 7 8 9 10 11...

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Another Normal Execution – No Errors

while loop to hand-trace

```
i = 5;
while (i > 5)
{
    cout << i << " ";
    i--;
}
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Another Normal Execution – No Errors

while loop

```
i = 5;
while (i > 5)
{
    cout << i << " ";
    i--;
}
```

There is (correctly) no output

The expression `i > 5` is initially false,  
so the statements are never executed.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Another Normal Execution – No Errors

while loop

```
i = 5;
while (i > 5)
{
    cout << i << " ";
    i--;
}
```

There is (correctly) no output

This is not a error.

Sometimes we *do not* want to execute the statements  
*unless* the test is true.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Normal Execution with Another “Programmer’s Error”

while loop to hand-trace

```
i = 5;
while (i < 0)
{
    cout << i << " ";
    i--;
}
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Normal Execution with Another “Programmer’s Error”

The programmer probably thought:  
“Stop when `i` is less than 0”.

However, the loop condition controls  
when the loop is *executed* - not when it *ends*.

while loop

```
i = 5;
while (i < 0)
{
    cout << i << " ";
    i--;
}
```

Again, there is no output

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## A Very Difficult Error to Find (especially after looking for it for hours and hours!)

while loop to hand-trace

```
i = 5;
while (i > 0);
{
    cout << i << " ";
    i--;
}
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## A Very Difficult Error to Find (especially after looking for it for hours and hours!)

Another infinite loop – caused by a single character: **;**

That semicolon causes the **while** loop to have  
an “empty body” which is executed forever.

The `i` in `(i > 0)` is never changed.

while loop

```
i = 5;
while (i > 0);
{
    cout << i << " ";
    i--;
}
```

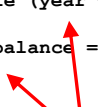

There is no output!

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Infinite Loops

- Forgetting to update the variable used in the condition is common.
- In the investment program, it might look like this.

```
year = 1;
while (year <= 20)
{
    balance = balance * (1 + RATE / 100);
}
```

- The variable `year` is not updated in the body

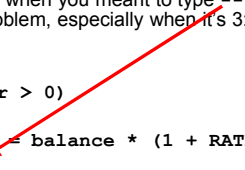

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Infinite Loops

Another way to cause an infinite loop:  
Typing on “autopilot”

Typing `++` when you meant to type `--`  
is a real problem, especially when it's 3:30 am!

```
year = 20;
while (year > 0)
{
    balance = balance * (1 + RATE / 100);
    year++;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### A Not Really Infinite Infinite Loop

- Due to what is called “wrap around”, the previous loop **will** end.
- At some point the value stored in the `int` variable gets to the largest representable positive integer. When it is incremented, the value stored “wraps around” to be a negative number.

That definitely stops the loop!

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Are We There Yet?

When doing something repetitive,  
most of us want to know when we are done.

For example, you may think,  
“I want to get at least \$20,000,”  
and set the loop condition to

```
while (balance >= TARGET)
```

 wrong test

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Are We There Yet?

But the `while` loop thinks the opposite:  
How long am I allowed to keep going?

What is the correct loop condition?

```
while ( )
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Are We There Yet?

But the `while` loop thinks the opposite:  
How long am I allowed to keep going?

What is the correct loop condition?

```
while (balance < TARGET)
```

In other words:  
“Keep at it while the balance  
is less than the target”.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Are We There Yet?

When writing a loop condition, don't ask, "Are we there yet?"

The *condition* determines how long the loop will keep going.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Off-by-One Errors

In the code to find when we have doubled our investment:

Do we start the variable for the years  
at 0 or 1 years?

Do we test for `< TARGET`  
or for `<= TARGET`?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Common Error – Off-by-One Errors

- Maybe if you start trying some numbers and add +1 or -1 until you get the right answer you can figure these things out.
- It will most likely take a very long time to try ALL the possibilities.
- No, just try a couple of "test cases" (*while thinking*).

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Use Thinking to Decide!

- Consider starting with \$100 and a **RATE** of 50%.
  - We want \$200 (or more).
  - At the end of the first year, the balance is \$150 – not done yet
  - At the end of the second year, the balance is \$225 – definitely over **TARGET** and we are done.
- We made two increments.

What must the original value be so that we end up with 2?

Zero, of course.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Use Thinking to Decide!

Another way to think about the initial value is:

Before we even enter the loop, what is the correct value?

Most often it's zero.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### < vs. <= (More Thinking)

- Figure out what you want:

"we want to keep going until  
we have doubled the balance"

- So you might have used:

`(balance < TARGET)`

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

**< vs. <= (More Thinking)**

- But consider, did you really mean:

“...to have *at least* doubled...”

Exactly twice as much would happen with a **RATE** of 100% - the loop should top then

- So the test must be `(balance <= TARGET)`

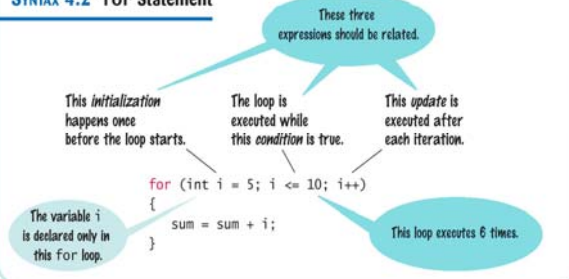

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

**The for Loop (4.2)**

To execute statements a certain number of times

You “*simply*” take 4,522 steps!!!

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

**The for Loop****SYNTAX 4.2 for Statement**

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

**The for Loop**

```
for (initialization; check; update)
{
    statements
}
```

The *check* is some kind of test (the same as the condition in the *while* loop)

It is usually used to cause the *statements* to happen a certain number of times.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

**The for Loop**

```
for (initialization; check; update)
{
    statements
}
```

The *statements* are repeatedly executed until the check is false.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

**The for Loop**

```
for (initialization; check; update)
{
    statements
}
```

The *initialization* is code that happens once, before the check is made, in order to set up for counting how many times the *statements* will happen.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The for Loop

```
for (initialization; check; update)
{
    statements
}
```

The *update* is code that causes the check to eventually become false.

Usually it's incrementing or decrementing the loop variable.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The for Loop Is Better than while for Doing Certain Things

Consider this code which write the values 1 through 10 on the screen:

```
int count = 1; // Initialize the counter
while (count <= 10) // Check the counter
{
    cout << count << endl;
    count++; // Update the counter
}
```

*initialization*   *check*   *statements*   *update*

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The for Loop Is Better than while for Doing Certain Things

Doing something a certain number of times or causing a variable to take on a sequence of values is so common, C++ has a statement just for that:

```
for (int count = 1; count <= 10; count++)
{
    cout << count << endl;
}
```

*initialization*   *check*   *statements*   *update*

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Execution of a for Statement

Consider this **for** statement:

```
int count;
for (count = 1; count <= 10; counter++)
{
    cout << counter << endl;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

1 Initialize counter	for (counter = 1; counter <= 10; counter++)
counter = 1	{
	cout << counter << endl;
	}
2 Check counter	for (counter = 1; counter <= 10; counter++)
counter = 1	{
	cout << counter << endl;
	}
3 Execute loop body	for (counter = 1; counter <= 10; counter++)
counter = 1	{
	cout << counter << endl;
	}
4 Update counter	for (counter = 1; counter <= 10; counter++)
counter = 2	{
	cout << counter << endl;
	}
5 Check counter again	for (counter = 1; counter <= 10; counter++)
counter = 2	{
	cout << counter << endl;
	}

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Scope of the Loop Variable – Part of the for or Not?

- The "loop variable" when defined as part of the **for** statement cannot be used before or after the **for** statement – it only exists as part of the **for** statement and should not need to be used anywhere else in a program.
- A **for** statement can use variables that are not part of it, but they should not be used as the loop variable.

(In the preceding trace, **counter** was defined before the loop – so it does work. Normally **counter** would be defined in the *initialization*.)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Solving a Problem with a `for` Statement

- Earlier we determined the number of years it would take to (at least) double our balance.
- Now let's see the interest in action:
  - We want to print the balance of our savings account over a five-year period.
  - The "...over a five-year period" indicates that a `for` loop should be used. Because we know how many times the statements must be executed we choose a `for` loop.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Solving a Problem with a `for` Statement

The output should look something like this:

Year	Balance
1	10500.00
2	11025.00
3	11576.25
4	12155.06
5	12762.82

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The `for` Loop

Flowchart of the investment calculation's `while` loop

Easily written using a `for` loop

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Solving a Problem with a `for` Statement

Two statements should happen five times.  
So use a `for` statement.

They are:

update balance  
print year and balance

```
for (int year = 1; year <= nyears; year++)
{
    // update balance
    // print year and balance
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Modified Investment Program Using a `for` Loop

```
#include <iostream>
#include <omanip>
using namespace std;

int main()
{
    const double RATE = 5;
    const double INITIAL_BALANCE = 10000;
    double balance = INITIAL_BALANCE;
    int nyears;

    cout << "Enter number of years: ";
    cin >> nyears;

    cout << fixed << setprecision(2);
    for (int year = 1; year <= nyears; year++)
    {
        balance = balance * (1 + RATE / 100);
        cout << setw(4) << year << setw(10) << balance << endl;
    }

    return 0;
}
```

ch04/invtable.cpp

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Modified Investment Program Using a `for` Loop

A run of the program:

```
Enter number of years: 10
1 10500.00
2 11025.00
3 11576.25
4 12155.06
5 12762.82
6 13400.96
7 14071.00
8 14774.55
9 15513.28
10 16288.95

## More for Examples

For each of the following, do a hand-trace.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Example of Normal Execution

for loop to hand-trace

```
for (int i = 0;
     i <= 5;
     i++)
    cout << i << " ";
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Example of Normal Execution

for loop

```
for (int i = 0;
     i <= 5;
     i++)
    cout << i << " ";
```

The output

0 1 2 3 4 5

Note that the output statement is executed six times, not five

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Example of Normal Execution – Going in the Other Direction

for loop to hand-trace

```
for (int i = 5;
     i <= 0;
     i--)
    cout << i << " ";
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Example of Normal Execution – Going in the Other Direction

Again six executions of the output statement occur.

for loop

```
for (int i = 5;
     i <= 0;
     i--)
    cout << i << " ";
```

The output

5 4 3 2 1 0

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Example of Normal Execution – Taking Bigger Steps

for loop to hand-trace

```
for (int i = 0;
     i < 9;
     i += 2)
    cout << i << " ";
```

What is the output?

0 2 4 6 8

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Example of Normal Execution – Taking Bigger Steps

for loop

```
for (int i = 0;
     i < 9;
     i += 2)
    cout << i << " ";
```

The output

0 2 4 6 8

The "step" value can be added to or subtracted from the loop variable.

Here the value 2 is added.

There are only 5 iterations, though.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Infinite Loops Can Occur in for Statements

The danger of using == and/or !=

for loop to hand-trace

```
for (int i = 0;
     i != 9;
     i += 2)
    cout << i << " ";
```

What is the output?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Infinite Loops Can Occur in for Statements

== and != are best avoided  
in the check of a for statement

for loop

```
for (int i = 0;
     i != 9;
     i += 2)
    cout << i << " ";
```

The output never ends

0 2 4 6 8 10 12...

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Example of Normal Execution – Taking Even Bigger Steps

for loop to hand-trace

```
for (int i = 1;
     i <= 20;
     i *= 2)
    cout << i << " ";
```

What is the output?

The update can be any expression

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Example of Normal Execution – Taking Even Bigger Steps

for loop

```
for (int i = 1;
     i <= 20;
     i *= 2)
    cout << i << " ";
```

The output

1 2 4 8 16

The "step" can be multiplicative or any valid expression

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Confusing Everyone, Most Likely Including Yourself

- A **for** loop is an *idiom* for a loop of a particular form. A value runs from the start to the end, with a constant increment or decrement.
- As long as all the expressions in a **for** loop are valid, the compiler will not complain.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Confusing Everyone, Most Likely Including Yourself

A `for` loop should only be used to cause a loop variable to run, with a consistent increment, from the start to the end of a sequence of values.

Or you could write this (it works, but ...)

```
for (cout << "Inputs: "; cin >> x; sum += x)
{
    count++;
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Know Your Bounds – Symmetric vs. Asymmetric

- The start and end values should match the task the `for` loop is solving.
- The range  $3 \leq n \leq 17$  is *symmetric*, both end points are included so the `for` loop is:

```
for ( int n=3; n<=17; n++ )...
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Know Your Bounds – Symmetric vs. Asymmetric

- When dealing with arrays (in a later chapter), you'll find that if there are  $N$  items in an array, you must deal with them using the range  $[0..N)$ . So the `for` loop for arrays is:

```
for ( int arrIndVar=0;
      arrIndVar<N;
      arrIndVar++ )...
```

- This still executes the statements  $N$  times.

Many coders use this *asymmetric* form for **every** problem involving doing something  $N$  times.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### How Many Times Was That?

Fence arithmetic

Don't forget to count the first (or last) "post number" that a loop variable takes on

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Fence Arithmetic – Counting Iterations

- Finding the correct lower and upper bounds and the correct check for an iteration can be confusing.
  - Should you start at 0 or at 1?
  - Should you use  $\leq b$  or  $< b$  as a termination condition?
- Counting the number of iterations is a very useful device for better understanding a loop.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Fence Arithmetic – Counting Iterations

Counting is easier for loops with *asymmetric* bounds.

The loop

```
for (i = a; i < b; i++)...
```

executes the statements  $(b - a)$  times and when  $a$  is 0:  $b$  times.

For example, the loop traversing the characters in a **string**,

```
for (i = 0; i < s.length(); i++)...
```

runs `s.length` times.

That makes perfect sense, since there are `s.length` characters in a **string**.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Fence Arithmetic Again – Counting Iterations

The loop with symmetric bounds,  
`for (i = a; i <= b; i++)...`  
 is executed  $(b - a) + 1$  times.

That "+1" is the source of many programming errors.

C++ for Everyone by Cay Horstmann  
 Copyright © 2008 by John Wiley & Sons. All rights reserved

### The do Loop (4.3)

The **while** loop's condition test is the first thing that occurs in its execution.

The **do** loop (or **do-while** loop) has its condition tested only after at least one execution of the statements.

C++ for Everyone by Cay Horstmann  
 Copyright © 2008 by John Wiley & Sons. All rights reserved

### The do Loop

This means that the **do** loop should be used only when the statements must be executed before there is any knowledge of the condition.

This also means that the **do** loop is the least used loop.

C++ for Everyone by Cay Horstmann  
 Copyright © 2008 by John Wiley & Sons. All rights reserved

### The do Loop

What problems require something to have happened before the testing in a loop?

Getting valid user input is often cited.

Here is the flowchart for the problem in which the user is supposed to enter a value less than 100 and processing must not continue until they do.

C++ for Everyone by Cay Horstmann  
 Copyright © 2008 by John Wiley & Sons. All rights reserved

### The do Loop

Here is the code:

```

int value;
do
{
    cout << "Enter a value < 100";
    cin >> value;
}
while (value >= 100);
  
```

In this form, the user sees the same prompt each time until the enter valid input.

C++ for Everyone by Cay Horstmann  
 Copyright © 2008 by John Wiley & Sons. All rights reserved

### The do Loop

In order to have a different, "error" prompt that the user sees only on *invalid* input, the initial prompt and input would be before a **while** loop:

```

int value;
cout << "Enter a value < 100";
while (value >= 100);
{
    cout << "Sorry, that is larger than 100\n"
        << "Try again: ";
    cin >> value;
}
  
```

Notice what happens when the user gives valid input on the first attempt: nothing – good.

C++ for Everyone by Cay Horstmann  
 Copyright © 2008 by John Wiley & Sons. All rights reserved

## Nested Loops (4.4)

For each hour, 60 minutes are processed – a nested loop.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Nested Loops

- Nested loops are used mostly for data in tables as rows and columns.
- The processing across the columns is a loop, as you have seen before, “nested” inside a loop for going down the rows.
- Each row is processed similarly so design begins at that level. After writing a loop to process a generalized row, that loop, called the “inner loop,” is placed inside an “outer loop.”

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Nested Loops

Write a program to produce a table of powers.  
The output should be something like this:

$x^1$	$x^2$	$x^3$	$x^4$
1	1	1	1
2	4	8	16
3	9	27	81
...	...	...	...
10	100	1000	10000

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Nested Loops

- The first step is to solve the “nested” loop.
- There are four columns and in each column we display the power. Using  $x$  to be the number of the row we are processing, we have (in pseudo-code):

```
for n from 1 to 4
{
    print  $x^n$ 
}
```

- You would test that this works in your code before continuing. If you can't correctly print one row, why try printing lots of them?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Nested Loops

Now, putting the inner loop into the whole process we have:

(don't forget to indent, nestedly)

```
print table header
for x from 1 to 10
{
    print table row
    print endl
}
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## The Complete Program for Table of Powers

```
#include <iostream>
#include <iomanip>
#include <cmath>
using namespace std;

int main()
{
    const int NMAX = 4;
    const double XMAX = 10;

    // Print table header
    for (int n = 1; n <= NMAX; n++)
    {
        cout << setw(10) << n;
    }
    cout << endl;
    for (int n = 1; n <= NMAX; n++)
    {
        cout << setw(10) << "x ";
    }
    cout << endl << endl;
```

ch04/powtable.cpp

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Complete Program for Table of Powers

```
// Print table body
for (double x = 1; x <= XMAX; x++)
{
    // Print table row
    for (int n = 1; n <= NMAX; n++)
    {
        cout << setw(10) << pow(x, n);
    }
    cout << endl;
}

return 0;
```

The program run would be:

	1	2	3	4
x	x	x	x	x
1	1	1	1	1
2	4	8	16	
3	9	27	81	
4	16	64	256	
5	25	125	625	

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### More Nested Loop Examples

The loop variables can have a value relationship. In this example the inner loop depends on the value of the outer loop.

```
for (i = 1; i <= 4; i++)
    for (j = 1; j <= i; j++)
        cout << "*";
cout << endl;
```

The output will be:

```
*
**
***
****
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### More Nested Loop Examples

```
for (i = 1; i <= 4; i++)
    for (j = 1; j <= i; j++)
        cout << "*";
cout << endl;
```

j is the number of "columns"  
(or the line's length), which  
depends on the line number, i

j stops at: i i i i  
              1 2 3 4

```
line num. i 1 *
           i 2 **
           i 3 ***
           i 4 ****
```

i represents the  
row number or  
the line number

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### More Nested Loop Examples

In this example, the loop variables are still related, but the processing is a bit more complicated.

```
for (i = 1; i <= 3; i++)
{
    for (j = 1; j <= 5; j++)
    {
        if (i + j % 2 == 0) { cout << "*"; }
        else { cout << " "; }
    }
    cout << endl;
}
```

The output will be:

```
* * *
* * 
* * *
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Processing Input – When and/or How to Stop? (4.5)

- We need to know, when getting input from a user, when they are done.
- One method is to hire a sentinel (as shown)  or more correctly choose a *value* whose meaning is STOP!
- As long as there is a known range of valid data points, we can use a value not in it.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Processing Input – When and/or How to Stop?

- We will write code to calculate the average of some salary values input by the user.
- How many will there be?
- That is the problem. We can't know.
- But we can use a *sentinel value*, as long as we tell the user to use it, to tell us when they are done.
- Since salaries are never negative, we can safely choose -1 as our sentinel value.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Processing Input – When and/or How to Stop?

- In order to have a value to test, we will need to get the first input before the loop. The loop statements will process each non-sentinel value, and then get the next input.
- Suppose the user entered the sentinel value as the first input. Because averages involve division by the count of the inputs, we need to protect against dividing by zero. Using an **if-else** statement from Chapter 3 will do.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Complete Salary Average Program

```
#include <iostream>
using namespace std;

int main()
{
    double sum = 0;
    int count = 0;
    double salary = 0;

    // get all the inputs
    cout << "Enter salaries, -1 to finish: ";
    cin >> salary;
    while (salary != -1)
    {
        // process input
        sum = sum + salary;
        count++;

        // get next input
        cin >> salary;
    }
```

ch04/sentinel.cpp

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Complete Salary Average Program

```
// process and display the average
if (count > 0)
{
    double average = sum / count;
    cout << "Average salary: " << average << endl;
}
else
{
    cout << "No data" << endl;
}

return 0;
}
```

A program run:

```
Enter salaries, -1 to finish: 10 10 40 -1
Average salary: 20
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Using Failed Input for Processing

- Sometimes it is easier and a bit more intuitive to ask the user to "Hit Q to Quit" instead of requiring the input of a sentinel value.
- Sometimes picking a sentinel value is simply impossible – if any valid number is allowed, which number could be chosen?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Using Failed Input for Processing

- In the previous chapter we used `cin.fail()` to test if the most recent input failed.
- Note that if you intend to take more input from the keyboard after using failed input to end a loop, you must reset the keyboard with `cin.clear()`.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Using Failed Input for Processing

If we introduce a bool variable to be used to test for a failed input, we can use `cin.fail()` to test for the input of a 'Q' when we were expecting a number:

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Using Failed Input for Processing

```
cout << "Enter values, Q to quit: ";
bool more = true;
while (more)
{
    cin >> value;
    if (cin.fail())
    {
        more = false;
    }
    else
    {
        // process value here
    }
}
cin.clear() // reset if more input is to be taken
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Using Failed Input for Processing

- Using a `bool` variable in this way is disliked by many programmers.
- Why?
- `cin.fail` is set when `>>` fails. This allows the use of an input *itself* to be used as the test for failure.
  - Again note that if you intend to take more input from the keyboard, you must reset the keyboard with `cin.clear`.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Using Failed Input for Processing

Using the input attempt directly we have:

```
cout << "Enter values, Q to quit: ";
while (cin >> value)
{
    // process value here
}
cin.clear();
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Random Numbers and Simulations (4.6)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Simulations

A *simulation program* uses the computer to simulate an activity in the real world (or in an imaginary one).

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Simulations

- Simulations are commonly used for
  - Predicting climate change
  - Analyzing traffic
  - Picking stocks
  - Many other applications in science and business

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Randomness for Reality (Simulating)

- Programmers must model the “real world” at times.
- Consider the problem of modeling customers arriving at a store.

Do we know the rate?

Does anyone?

How about the shopkeeper!

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Randomness for Reality (Simulating)

To accurately model customer traffic, you want to take that random fluctuation into account.

How?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The `rand` Function

The C++ library has a random number generator:

`rand()`

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The `rand` Function

`rand` is defined in the `cstdlib` header

Calling `rand` yields a random integer between 0 and `RAND_MAX`

(The value of `RAND_MAX` is implementation dependent)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The `rand` Function

Calling `rand` again yields a different random integer

Very, very, very rarely it might be the same random integer again.

(That's OK. In the real world this happens.)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The `rand` Function

`rand` picks from a very long sequence of numbers that don't repeat for a long time.

But they do eventually repeat.

These sorts of “random” numbers are often called *pseudorandom numbers*.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The rand Function

`rand` uses only one pseudorandom number sequence and it always starts from the same place.

Oh dear

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The rand Function

When you run your program again on another day, the call to `rand` will start with:

the same random number!

Is it very "real world" to use the same sequence over and over?

No, but it's really nice for testing purposes.

but...

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Seeding the rand Function

You can "seed" the random generator to indicate where it should start in the pseudorandom sequence

Calling `srand` sets where `rand` starts

`srand` is defined in the `cstdlib` header

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Seeding the rand Function

But what value would be different every *time* you run your program?

(hint)

How about the time?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Seeding the rand Function

You can obtain the system time.

Calling `time(0)` gets the current time

Note the zero. It is required.

`time` is defined in the `time` header

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### Seeding the rand Function

Calling `srand` sets where `rand` starts.

Calling `time(0)` gets the current time.

So, to set up for "really, really random" random numbers on each program run:

```
srand(time(0)); // seed rand()
```

(Well, as "really random" as we can hope for.)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

Modeling Using the `rand` Function

Let's model a pair of dice,

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

Modeling Using the `rand` Function

one die at a time.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

Modeling Using the `rand` Function

What are the numbers on one die?

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

Modeling Using the `rand` Function

What are the bounds of the range of numbers on one die?  
1 and 6 (inclusive)

We want a value randomly between those endpoints  
(inclusively)

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

Modeling Using the `rand` Function

Given two endpoints,  
**a** and **b**, recall there are

$$(b - a + 1)$$

values between **a** and **b**,  
(including the bounds themselves).

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

Modeling Using the `rand` Function

`rand() % (b - a + 1)`

Obtain a random value  
between 0 and **b - a**  
by using the `rand()` function

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Modeling Using the rand Function

## Modeling Using the rand Function

Using 1 and 6 as the bounds  
and  
modeling for two dice,  
running for 10 tries,  
we have:

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

## Modeling Using the rand Function

```
#include <iostream>
#include <string>
#include <cstdlib>
#include <ctime>
using namespace std;

int main()
{
    srand(time(0));
    int i;
    for (i = 1; i <= 10; i++)
    {
        int d1 = rand() % 6 + 1;
        int d2 = rand() % 6 + 1;
        cout << d1 << " " << d2 << endl;
    }
    cout << endl;
    return 0;
}
```

ch04/dice.cpp

One of many different  
Program Runs:

```
5 1
2 1
1 2
5 1
1 2
6 4
4 4
6 1
6 3
5 2
```

### The Monte Carlo Method

The Monte Carlo method is a method for finding approximate solutions to problems that cannot be precisely solved.

Here is an example: compute  $\pi$

This is difficult.

### The Monte Carlo Method

While we are in this fine casino,  
we should at least play one game at the "table d'darts"

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

THAT'S IT!

By shooting darts (and a little math)  
we can obtain an approximation for  $\pi$ .

### The Monte Carlo Method

Consider placing the round dartboard  
inside an exactly fitting square

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

As we toss darts at the target,  
if we are able to just *hit* the target – at all – it's a hit.

(no wonder this is such a pathetic casino)

### The Monte Carlo Method

and a *miss* is a miss.

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

The  $(x, y)$  coordinate of a *hit* is when  $(x^2 + y^2) \leq 1$ .  
In code:

```
if (x * x + y * y <= 1) { hits++; }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

Our coded random shots will give a ratio of *hits/tries*  
that is approximately equal to the ratio of  
the areas of the circle and the square:

$$\pi/4$$

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

Multiply by 4 and we have an estimate for  $\pi$ !

```
 $\pi$  = 4 * hits/tries;
```

The longer we run our program,  
the more random numbers,  
the better the estimate.

### The Monte Carlo Method

For the  $x$  and  $y$  coordinates within the circle,  
we need random  $x$  and  $y$  values between  $-1$  and  $1$ .

That's a range of  $(-1 + 1 + 1)$  or  $2$ .

As before, we want add some random portion  
of this range to the low endpoint,  $-1$ .

But we will want a floating point value, not an integer.

C++ for Everyone by Cay Horstmann

### The Monte Carlo Method

We must use `rand` with `double` values  
to obtain that random portion.

```
double r = rand() * 1.0 / RAND_MAX;
```

The value  $r$  is a random floating-point  
value between  $0$  and  $1$ .

You can think of this as a percentage if you like.

(Use `1.0` to make the `/` operator not do integer division)

### The Monte Carlo Method

The computation:

```
double x = -1 + 2 * r;
```

2 is the length of the range from  $-1$  to  $1$

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

The computation:

```
double x = -1 + 2 * r;
```

2 is the length of the range from -1 to 1

r is some random value between 0.0 and 1.0

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

The computation:

```
double x = -1 + 2 * r;
```

2 is the length of the range from -1 to 1

r is some random value between 0.0 and 1.0

so (2 \* r) is some portion of that range

C++ for Everyone by Cay Horstmann

### The Monte Carlo Method

The computation:

```
double x = -1 + 2 * r;
```

2 is the length of the range from -1 to 1

r is some random value between 0.0 and 1.0

so (2 \* r) is some portion of that range

We will add this portion to the left hand end of the range, -1

C++ for Everyone by Cay Horstmann  
Copyright © 2008 by John Wiley & Sons. All rights reserved

### The Monte Carlo Method

The computation:

```
double x = -1 + 2 * r;
```

2 is the length of the range from -1 to 1

r is some random value between 0.0 and 1.0

so (2 \* r) is some portion of that range

Adding this portion to the left hand end of the range gives us:

x randomly within the range -1 and 1.

### The Monte Carlo Method for Approximating PI

```
#include <iostream>
#include <cstdlib>
#include <cmath>
#include <ctime>
using namespace std;
int main()
{
    const int TRIES = 10000;
    srand(time(0));
    int hits = 0;
    for (int i = 1; i <= TRIES; i++)
    {
        double r = rand() * 1.0 / RAND_MAX; // Between 0 and 1
        double x = -1 + 2 * r; // Between -1 and 1
        r = rand() * 1.0 / RAND_MAX;
        double y = -1 + 2 * r;
        if (x * x + y * y <= 1) { hits++; }
    }
    double pi_estimate = 4.0 * hits / TRIES;
    cout << "Estimate for pi: "
         << pi_estimate << endl;
    return 0;
}
```

### Chapter Summary

1. Loops execute a block of code repeatedly while a condition remains true.
2. An off-by-one error is a common error when programming loops. Think through simple test cases to avoid this type of error.
3. The for loop is used when a value runs from a starting point to an ending point with a constant increment or decrement.
4. The do loop is appropriate when the loop body must be executed at least once.
5. Nested loops are commonly used for processing tabular structures.
6. A sentinel value denotes the end of a data set, but it is not part of the data.
7. You can use a Boolean variable to control a loop. Set the variable to true before entering the loop, then set it to false to leave the loop.
8. In a simulation program, you use the computer to simulate an activity. You can introduce randomness by calling the random number generator.
